

Data Center Rack Wide Temperature Range Operation Guide

What temperature should a server rack be?

The sweet spot is typically 75°F-78°F. Server rack temperature directly affects hardware reliability, energy efficiency, and operational costs. Maintaining 68°F-77°F (20°C-25°C) minimizes overheating risks while balancing cooling expenses. ASHRAE recommends this range for modern servers, though some operators push to 80°F (27°C) for energy savings.

What temperature should a data center be?

ASHRAE issued its first thermal guidelines for data centers in 2004. The original ASHRAE recommended envelope for data centers was 20-25°C (68-77°F). This was a conservative statement, based on data available at the time, on where a data center could be reliably operated. Re

Can a rack cool a data center?

Immersion Cooling for Edge Racks: Compact, rack-sized immersion tanks are being developed for edge data centers, enabling high-density computing in remote locations with limited power. Waste heat from rack cooling will be repurposed for other uses, turning data centers into "thermal energy hubs."

How do data centers optimize rack cooling?

Modern data centers rely on real-time monitoring and automation to optimize rack cooling--especially as densities and workloads become more dynamic. Rack-Level Monitoring: Facility-wide temperature sensors are insufficient--install sensors at rack inlets, outlets, and hot zones to track localized conditions.
