

Are flexible solar cells the future of photovoltaic technology?

For the previous few decades, the photovoltaic (PV) market was dominated by silicon-based solar cells. However, it will transition to PV technology based on flexible solar cells recently because of increasing demand for devices with high flexibility, lightweight, conformability, and bendability.

Which materials are suitable for flexible solar cells?

Here, the flexible substrates, transparent electrode materials, photovoltaic materials and devices for flexible solar cells are systematically introduced. First, the flexible substrates regarding their suitability are provided.

Can a photovoltaic material be used for flexible solar cells?

In general, if a photovoltaic material can be deposited onto a substrate at temperatures below 300 °C, the material can potentially be used in fabricating flexible solar cells. Several types of active materials, such as a-Si:H, CIGS, small organics, polymers, and perovskites, have broadly been investigated for flexible solar cell application.
