

# How big should the solar inverter be installed

What size solar inverter do I Need?

Your inverter size should match your solar array's capacity, not your electricity bill. This means your inverter doesn't need to power your entire home--it just converts whatever your panels generate. Let's say you have a 6kW solar array (twenty 300-watt panels).

How much does a solar inverter cost?

On average, solar inverter installation costs range from \$1,500 to \$3,500, depending on system size, location, and complexity. Costs may be higher for battery-ready or hybrid systems. Matching your inverter to your solar panel output is crucial. Too many panels can overload the system; too few, and you're not maximizing potential.

How do I choose a solar inverter?

Panel-to-inverter distance: The farther your solar panels are from the inverter, the more careful your installer must be about voltage drop and wiring efficiency. Main service panel location and capacity: The inverter connects to your home's main electrical panel. An overloaded or outdated panel may need upgrades before installation can proceed.

Can a solar inverter be too big?

Oversizing or having an inverter that is too big for your solar panels will not produce enough electricity. Undersizing or having an inverter that's too small will convert a limited amount of energy. You can avoid both of these scenarios by following these three basic steps to solar inverter sizing.
