

Photothermal energy storage power generation system process

Can a novel integrated system produce photothermal catalytic hydrogen?

Conclusion In summary, a novel integrated system (STHET) is firstly proposed to achieve photothermal catalytic hydrogen production coupled with low-grade waste heat utilization by flexible TEGs and thermal storage capacity of liquid phase system for continuous power generation in the dark.

What is solar to hydrogen-electricity and thermal storage system (sthet)?

Solar to hydrogen-electricity and thermal storage system (STHET) is proposed. Hydrogen production in STHET is improved by recycling scattered light. Low-grade waste heat is converted into electrical energy by flexible TEGs. STHET can achieve continuous power generation by self-thermal storage capability.

Can photothermal catalytic hydrogen production be achieved in the dark?

It is worth mentioning that the novel integrated system (STHET) is the first time proposed to achieve photothermal catalytic hydrogen production coupled with low-grade waste heat utilization by flexible TEG and thermal storage capacity for continuous power generation in the dark. Fig. 1.

How does photothermal catalysis work?

Energy storage during daylight and release at night for driving devices was an effective approach. In the process of photothermal catalysis, the solution was heated by light and accompanied by the storage of large amount of thermal energy owing to the large specific heat capacity of liquid water.
