

Principle of using solar energy to generate electricity

How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Solar is an important part of NESO's ambition to run the grid carbon zero by 2025. But how does solar power work, how much does the UK produce and what happens to solar on a cloudy day?

Can solar energy produce electrical energy?

In terms of renewable energy, solar energy is the most promising direction for producing electrical energy. For the efficient use of solar energy it is necessary to understand how electrical energy is produced from the sun. This document describes the principle of solar energy to generate electrical energy.

How can solar energy be converted into usable energy?

There are different ways of capturing solar radiation and converting it into usable energy. The methods use either active solar energy or passive solar energy. Active solar technologies use electrical or mechanical devices to actively convert solar energy into another form of energy, most often heat or electricity.
