

In this work, we studied the possibilities of using porous and gradient coatings as antireflective coatings for solar cells by computer simulation.

Strong adhesion, mechanical robustness and environmental durability are crucial for the application of anti-reflective superhydrophobic coatings in outdoor solar panels and architectural glass.

In hot climates, solar control glass can be used to minimise solar heat gain and help control glare. In temperate regions, it can be used to balance solar control with high levels of natural light.

Transform any glass surface into a bespoke work of art, while allowing controlled light transmission and providing full or partial privacy. MetWest's ombre gradient glass film can be completely custom with ...

Gradient window film represents the ideal solution for modern spaces that require both privacy and natural light. By creating a subtle transition from transparent to opaque, this innovative film ...

Thinner glass has less mass and a lower thermal capacity, so it heats up and cools down much faster than thicker glass. This makes it more susceptible to thermal shock and the rapid creation of high ...

Gradient films are an innovative approach to privacy, creating privacy in glass without compromising sightlines or natural light. These films are decorative and highly versatile, making them ...

Block Sunlight Heat Rejection Metallic Gradient Color Change Solar Sun Glass Car Window Tint Film

Gradient window films have an ombr&#233; effect, meaning they gradually fade in opacity from dark to light. They come in all different colors, shades, and transparencies.

? FULLY WATERPROOF & BUILT TO LAST: With an IP65 waterproof rating, our solar light withstands heavy rain and snow without letting dust in. It's perfectly suited for outdoor use year ...
