

The area of the generator air inlet and outlet shaft is not enough

Should a generator air inlet be facing the wind?

When ever possible,face the generator air inlet openings away from the wind. The wind can prevent the air intake louver from opening on start up. The air inlet must be capable of moving enough air through the room to provide the correct minimum CFM (cubic feet per minute) cooling for generator as specified by the generator's manufacturer.

Where is a diesel generator set installed?

In most cases,the diesel generator set is installed in the generator roomfor use. During the design process of the engine room,the air inlet and air outlet must be unblocked to ensure the air intake to supplement the air consumed by the generator combustion and the unit.

Where should a generator be located?

(Fig. 5.1.) The generator set should be located so that the engine receives air from the cold point of the room. If two or more units are installed,avoid placing the heated air from one unit into the inlet of the second unit.

(Fig. 5.2.)

Why should a generator be located in a cold room?

Therefore,the room should have a sufficient volume to ensure free air circulation,such that the temperature distribution is uniform and there are no areas with stagnant air. (Fig. 5.1.) The generator set should be located so that the engine receives air from the cold point of the room.

In rooms with a small volume, an air duct can be used for air intake or its direct supply to the engine. In addition, the outlet fan opening should be located on the outside of the opposite wall to release warm ...

Intake and exhaust areas are based on specified air velocities and a louver free area of 50% is used. Total required intake/exhaust areas are presented for the number of active generators and ...
